

# Live food enriched for Persian Sturgeon fish larvae: Growth, Survival and Resistance to salinities stress

Live foods in sturgeon fish larviculture are very important, not only for stock enhancement but also for aquaculture. In Iran these process were started since 1992 with producing more than 20 millions fingerlings, but high mortality in their larvae were found during the years because of using low quality live food. In this project we tried to perform high quality *Artemia urmiana* as live food, using the vitamin C and HUFA enrichment.
